

COUNTY SURVEYOR'S MAPS

These maps are compiled by the County Surveyor or County Engineer from record data and from survey data furnished by the county surveyor himself. These maps are indexed and filed in the office of the County Engineer.

Basically these maps show pertinent data on the retracement of section corners and the alignment of the center lines of streets, and while they are subject to changes and revisions, the original data is never removed from the map, and all changes in alignment are dated so that a reference to one of these maps in a legal description should use the following form:

"-----to the center line (or -----side line) of Union Street, 60.00 feet wide as it existed (March 12th 1961) and as shown on C. S. No. 6289 on file in the office of the County Engineer of said county;"
